

International Physiotherapy/Physical Therapy Ultrasound Imaging Survey

The use of ultrasound imaging (USI) in physiotherapy/physical therapy practice is gaining significant momentum. As training improves and equipment becomes more accessible, more therapists are enhancing their clinical practice by using USI. Equally USI is being used extensively in physical therapy and rehabilitation research.

In order to better understand the landscape in which therapists are using or not using USI, we are conducting an **international survey** of physiotherapists/physical therapists. We'd like to hear from those therapists that are using USI, as to how they use it and what training they have. We also want to hear from those therapists who are not using USI to understand why they don't use USI and the barriers that prevent them from doing so. The survey is translated into 20 different languages, so participation in the survey is easy!

All those who complete the survey can elect to go into the draw to win a \$1,000 USD Amazon.com gift card. For more information and to participate in the study, please go to...
